

GenAI Knowledge Assistant

Ask questions about GenAI, LLMs, embeddings, and more!

Your Question:

What is the role of embeddings in GenAI?

Retrieved Context (3 chunks):

Chunk 1

#genai

Similarity: 52.0%

Distance: 0.4798

GenAI applications combine multiple AI techniques: embeddings for meaning representation, LLMs for generation, and vector databases for retrieval. This combination enables intelligent assistants that understand context and provide relevant responses.

Chunk 2

#embeddings

Similarity: 42.3%

Distance: 0.5768

Embeddings are numerical vector representations that capture semantic meaning of text. They convert words, sentences, or documents into high-dimensional vectors. Embeddings allow machines to understand meaning and similarity between texts.

Chunk 3

#rag

Similarity: 27.0%**Distance: 0.7303**

Retrieval-Augmented Generation (RAG) combines information retrieval with LLM text generation. RAG retrieves relevant context from a knowledge base first, then uses that context to generate more accurate responses. This improves accuracy and reduces hallucinations.

 Assistant Response:

No response generated
